Momentum is always conserved" $\sum \Delta p = 0$, or $p_1 + p_2 = p_1' + p_2'$ "! Energy is always conserved" $\sum \Delta E = 0$, or $\sum E_i = \sum E_f$ "! In some collisions, there is very little energy "lost" to heat (sound, deformation). In these elastic collisions, kinetic energy is conserved:"! $K_1 + K_2 = K_1' + K_2'$!

conservation of momentum states that, within some problem domain, the amount of momentum remains constant; momentum is neither created nor destroyed, but only changed through the action of forces as described by Newton's laws of motion.

Conservation of Momentum

Conservation of momentum, general law of physics according to which the quantity called momentum that characterizes motion never changes in an isolated collection of objects; that is, the total momentum of a system remains constant. Momentum is equal to the mass of an object multiplied by its velocity and is equivalent to the force required to bring the object to a stop in a unit length of time.

Momentum Conservation - PDF Version

Momentum is conserved for any interaction between two objects occurring in an isolated system. This conservation of momentum can be observed by a total system momentum analysis or by a momentum change analysis. Useful means of representing such analyses include a momentum table and a vector diagram.

Momentum Conservation Principle - Physics

Like energy, mass, charge, and linear momentum conservation, another important quantity to be conserved is angular momentum. Angular momentum is defined as $L = I \omega$ and is the rotational equivalent of linear momentum. Its conservation demands that its value before a process and after the process should be the same for an isolated system.

According to the law of conservation of momentum, total momentum must be conserved. The final momentum of the first object is equal to $8 \text{ kg} \cdot 4 \text{ m/s} = 32 \text{ Ns}$. To ensure no losses, the second object must have momentum equal to $80 \text{ Ns} - 32 \text{ Ns} = 48 \text{ Ns}$, so its speed is equal to $48 \text{ Ns} / 4 \text{ kg} = 12 \text{ m/s}$.

Momentum is conserved whenever the net external force on a system is zero. This makes momentum conservation a fundamental tool for analyzing collisions. All of Work, Energy, and Energy Resources is devoted to momentum, and momentum has been important for many other topics as well, particularly where collisions were involved.
